PROJECTS

- **An ensemble classifier method for cervical cancer diagnosis**
  An ensemble classifier method for cervical cancer diagnosis is a machine learning approach that combines multiple individual classifiers to make predictions about whether a patient has cervical cancer or not.
  The ensemble classifier method takes advantage of the diversity and complementary
  strengths of different classifiers to improve the overall performance and accuracy of the prediction. Each individual classifier in the ensemble is trained independently on a subset
  of the available data or using different feature representations.Therefore,careful experimentation and evaluation are necessary to select the most effective ensemble classifier approach for a given cervical cancer diagnosis task.

- **Library Database Management System**
  A college library management is a project that manages and stores books information electronically according to students needs. The system helps both students and library manager to keep a constant track of all the books available in the library. It allows both the admin and the student to search for the desired book.
